1 Introduction

TheHive is an open source and free security incident response platform that helps security professionals deal with cyber threats and incidents. It is developed and maintained by TheHive Project, a community of security experts and enthusiasts. The source code of TheHive is hosted on GitHub, where any one can access, review, or contribute to it. In this report, we will provide a high level overview of the main modules.

2 Overview of the Source Code

The source code of TheHive is written mainly in Scala, a general-purpose programming language that runs on the Java Virtual Machine (JVM). The code is organized in to several modules and packages , each with a specific purpose and functionality. Figure 1 shows the structure of the source code

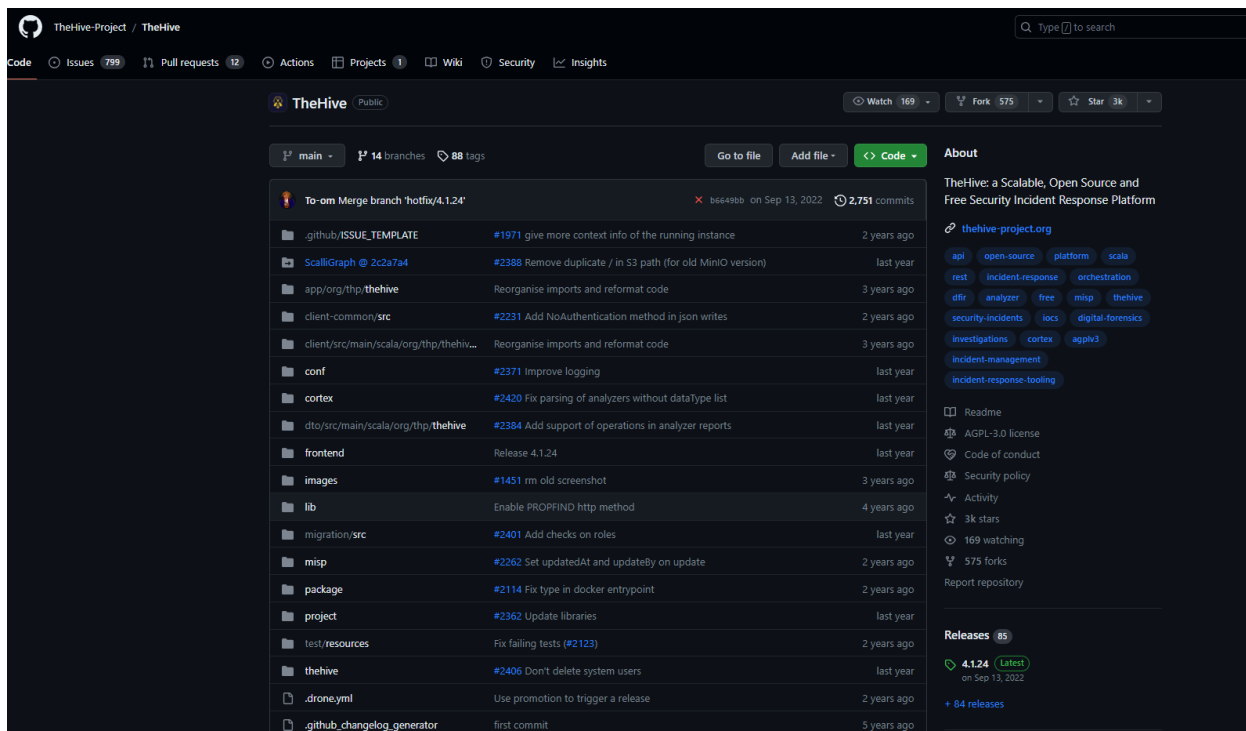

Figure 1: The structure of the source code of TheHive

We will briefly describe the main modules and packages of the source code in the following subsections.

2.1 app

This module contains the core logic and functionality of TheHive. It includes the following packages:

- `org.thp.thehive` : This package contains the main classes and traits that define the application, such as TheHive App , TheHive Module, and TheHive Config .
- `org.thp.thehive.controllers` : This package contains the controllers that handle the HTTP requests and responses for the different endpoints of the application, such as Cases, Tasks, Observables, Alerts, and Users.
- `org.thp.thehive.models` : This package contains the case classes and objects that represent the data models of the application, such as Case, Task, Observable, Alert, User, and Organisation.
- `org.thp.thehive.services` : This package contains the services that provide the business logic and operations for the datamodels, such as CaseSrv, TaskSrv, ObservableSrv, AlertSrv, UserSrv, and OrganisationSrv.
- `org.thp.thehive.connector` : This package contains the classes and traits that enable the integration with external tools and platforms, such as MISP and Cortex.

2.2 client

This module contains the code for the web-based user interface of TheHive. It includes the following packages:

- `org.thp.thehive.client` : This package contains the classes and objects that define the client-side application, such as ClientApp and ClientConfig .
- `org.thp.thehive.client.pages` : This package contains the components that render the different pages of the user interface, such as DashboardPage, CasePage, TaskPage, ObservablePage, AlertPage, and UserPage .
- `org.thp.thehive.client.services` : This package contains the services that provide the client-side logic and operations for the user interface, such as ApiService, Notification Service, UserService, and Organisation Service.

2.3 conf

This module contains the configuration files for the application, such as `application.conf` and `logback.xml`.

2.4 cortex

This module contains the code for the integration with Cortex. It includes the following packages:

- `org.thp.cortex.client` : This package contains the classes and objects that define the client-side communication with Cortex, such as CortexClient and CortexConfig .
- `org.thp.cortex.dto` : This package contains the case classes and objects that represent the data models of Cortex, such as Analyzer, Job, Report, Responder, Action, Response.

2.5 dto

This module contains the code for the data transfer objects (DTOs) that are used to exchange data between different layers of the application. It includes the following package:

- `org.thp.thehive.dto` : This package contains the case classes and objects that represent the DTOs of TheHive , such as CaseDTO, TaskDTO, ObservableDTO, AlertDTO, UserDTO.

2.6 frontend

This module contains the code for building and packaging the frontend assets of TheHive. It includes files such as `webpack.config.js` and `package.json`.

2.7 lib

This module contains some third-party libraries that are used by TheHive. It includes files such as `scala-graph.jar` and `elastic4play.jar`.

2.8 migration

This module contains some scripts and tools for migrating data from previous versions of TheHive. It includes files such as `migration.sh` and `migration.conf`.

2.9 MISP

This module contains some scripts and tools for synchronizing data with MISP. It includes files such as `misp.sh` and `misp.conf`.

2.10 project

This module contains some files for managing the project dependencies and build process. It includes files such as `build.sbt` and `plugins.sbt`.

2.11 test

This module contains some files for testing the application. It includes files such as `test.conf` and `test.sh`.

3 Key Features

The Hive is a security tool that aims to make life easier for security incident responders. Some of the key features of The Hive are:

- **Case management** : TheHive allows users to create cases from different sources, such as email, MISP events, SIEM alerts, or manually. Users can assign tasks to analysts, track the progress of the investigation, add observables, attach files, and write notes. Users can also use templates to standardize their case creation and workflow.
- **Observable analysis** : TheHive integrates with Cortex, a powerful observable analysis and active response engine. Thanks to Cortex, users can analyze observables such as IP and email addresses, URLs, domain names, files or hashes using a web interface or through the REST API. Users can also automate these operations and submit large sets of observables from The Hive or from alternative SIRP platforms, custom scripts or MISP.
- **Active response** : Cortex also enables users to perform active response actions on observables, such as blocking an IP address, disabling a user account, or quarantining a file. These actions can be triggered manually or automatically based on predefined rules.
- **Information sharing** : TheHive is tightly integrated with MISP, a platform for sharing threat intelligence among security teams. Users can import MISP events as cases in TheHive, or export cases as MISP events. Users can also synchronize their observables with MISP attributes, and enrich them with MISP taxonomies and galaxies.

4 Key Components

4.1 Organizations

- Organization settings : Allow users to configure the name, description, logo, and default roles of an organization.
- Organization users : The members of an organization who can access and work on cases and observables. Users can have different roles and permissions within an organization, such as admin, analyst, or read-only .
- Organization templates : Predefined case templates that can be used by an organization to create new cases with specific tasks and metrics. Templates can be shared with other organizations or imported from external sources.
- Organization metrics : Custom fields that can be used to measure and track the performance and progress of an organization's cases. Metrics can be defined by an organization admin and assigned to case templates or individual cases.

4.2 Cases

Cases are the security incidents that need to be investigated and handled by analysts using The Hive security tool. Cases can have various attributes, such as title, description, severity , start date, end date, tasks, and observables. Cases can also be shared with other organizations or platforms, such as MISP or Cortex .

4.3 Task

Task is a component of The Hive security tool that represents a sub-activity that needs to be performed to handle a case. Tasks can have their own title, description, status, owner, start date, end date, logs, and attachments . Tasks can also be assigned to different analysts or teams within an organization. Tasks can be created from case templates or manually by users.

4.4 Observables

Observables are the data elements that can be analyzed by Cortex or shared with MISP within The Hive security tool. Observables can have different types, such as IP address, URL, file, hash, etc., and different tags, such as IOC, TLP , or custom tags. Observables can also be ignored for similarity calculation between cases and alerts.

5 Documentation of Key features

5.1 Organization Admin

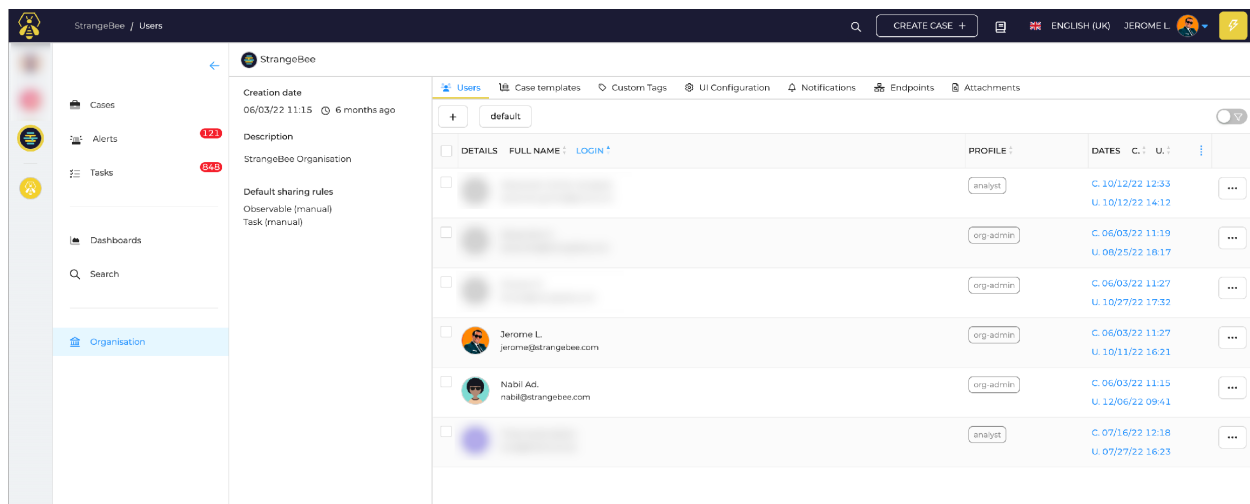

5.1.1 Manage Users

List of Users

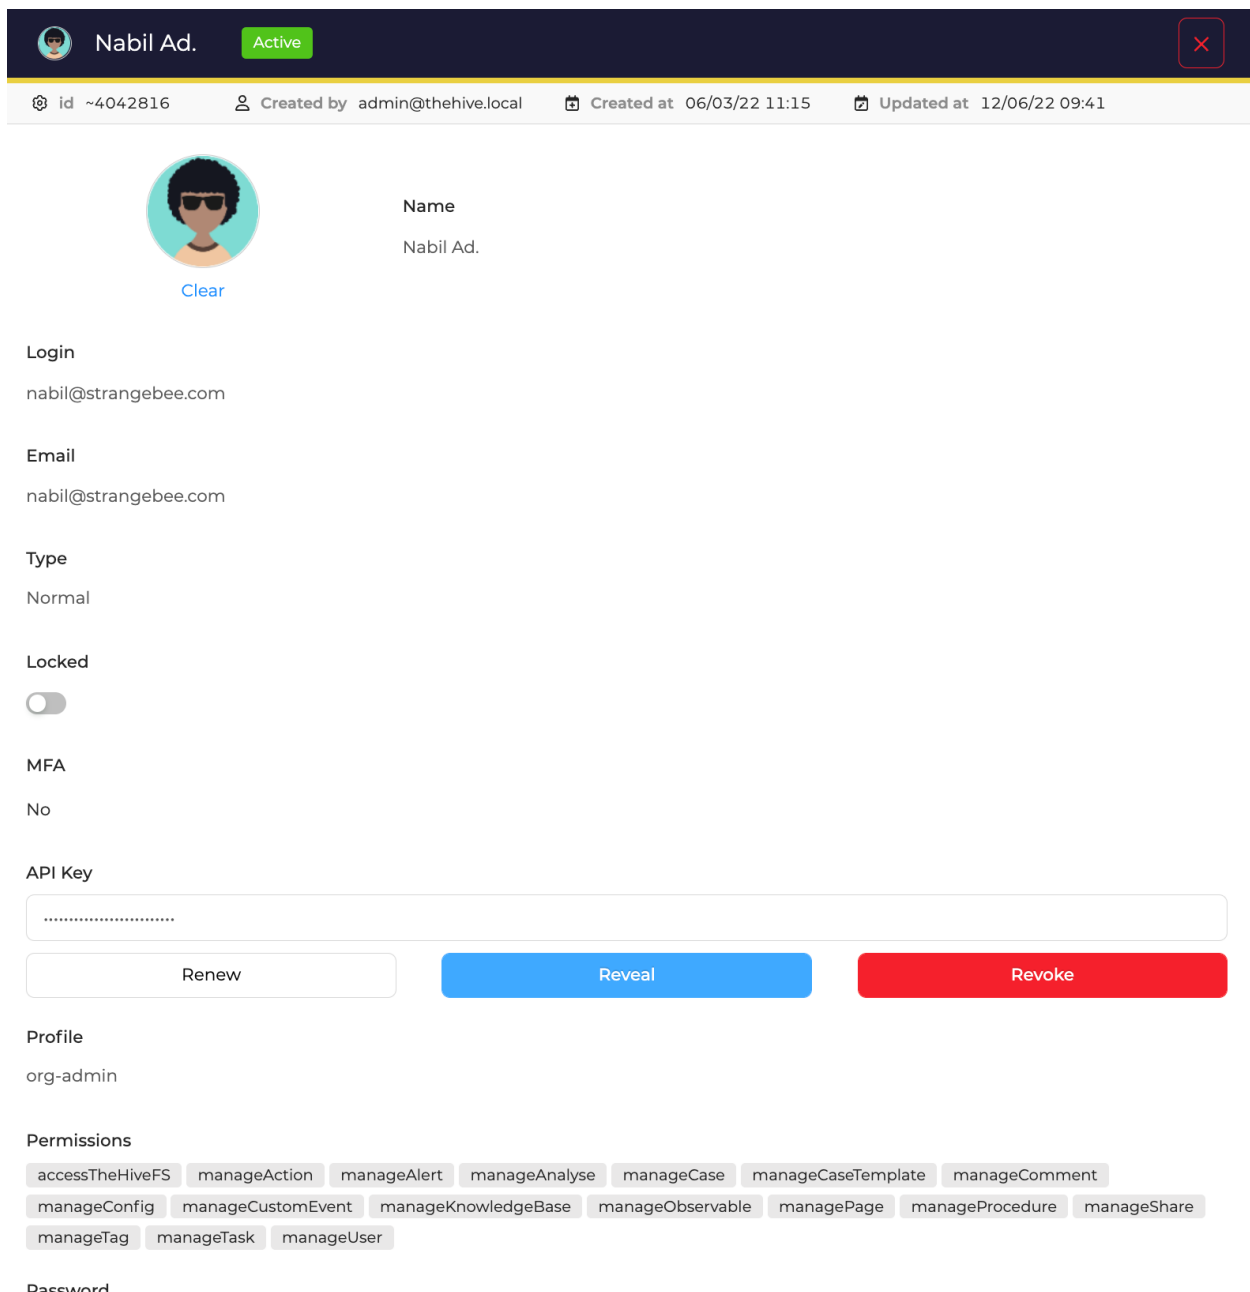

To see a list of people in your organization, click on Organisation in the menu on the left. Users is the first tab.

User information

Click the Preview button to see more details about a user.

Figure

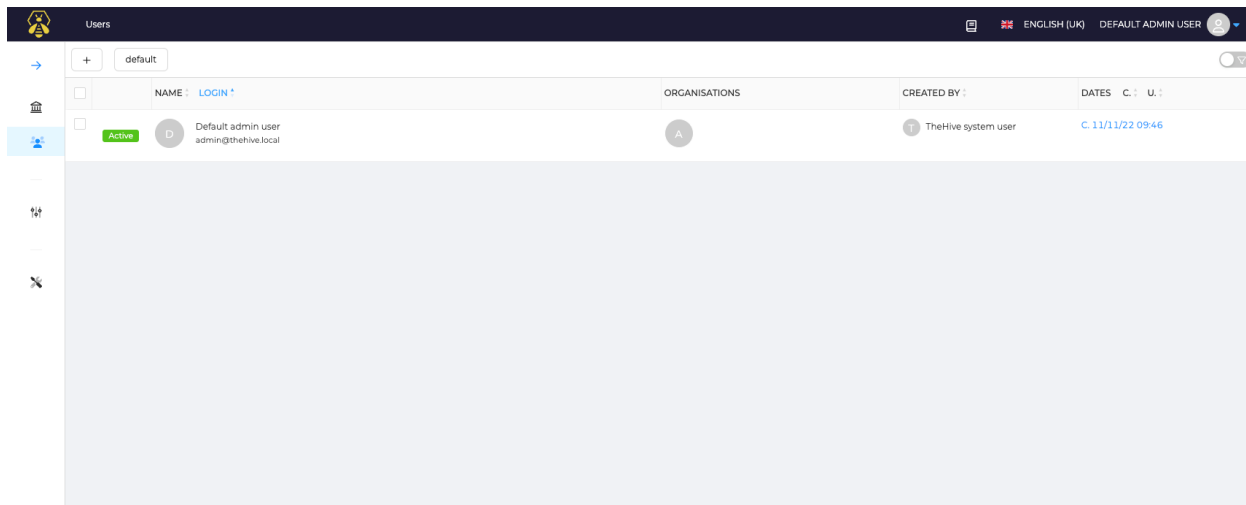

Configuration parameters

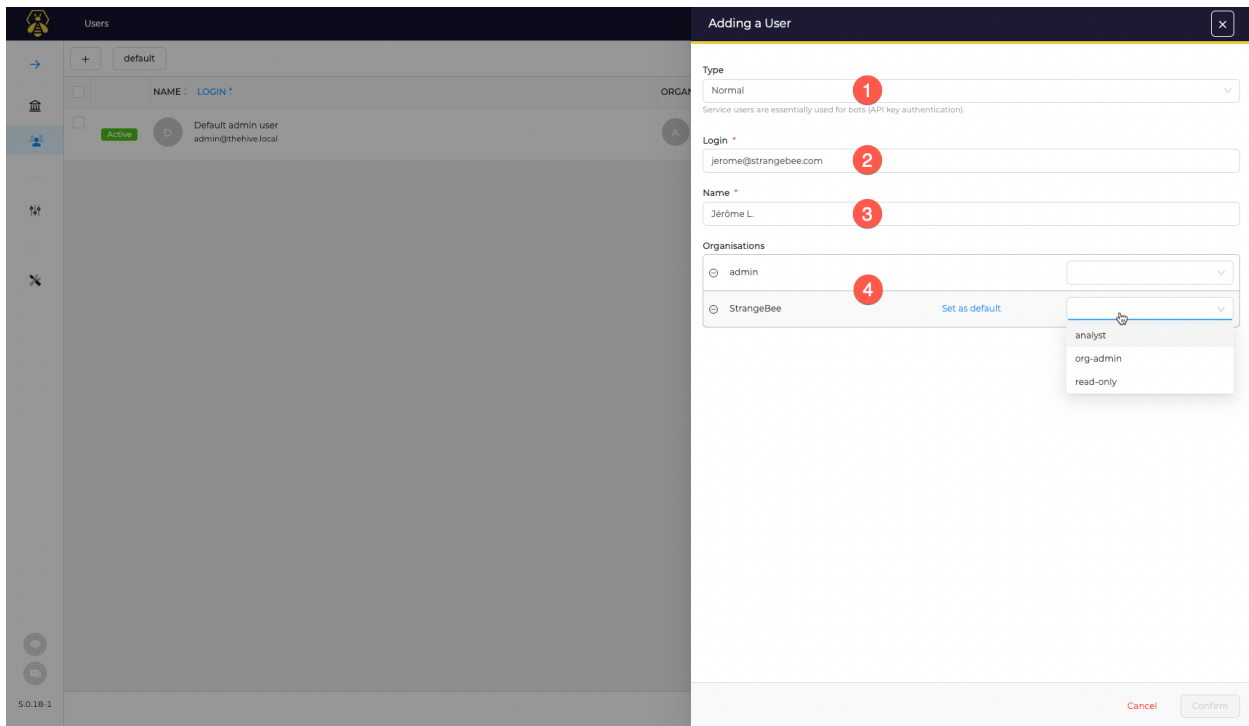

- Avatar : Up date the avatar associated with the user by drag and drop a new file (PNG or JPG files).
- Login : User login
- Email : email address for the account. This is used to send notifications or reset password links to users. Login is used if no email is filled there
- Type : Type of the account. Normal or Service. A Service account cannot open interactive session
- Locked : Block a user from logging in the application
- MFA : Tells if a user has configured MFA or not (Multi Factor Authentication). If yes, Yes is displayed
- API Key : Define, Renew, Reveal or Revoke API key of the account
- Profile : Information about the profile given to the user
- Permissions : List of permissions included in the profile
- Password : Create or up date the password of the user
- Reset Password : If the application is configured with a SMTP server, send an email with a magic link to the user. link is active for a short time period.
- Sessions : List of opened interactive sessions. Click delete to close a session

Add Users

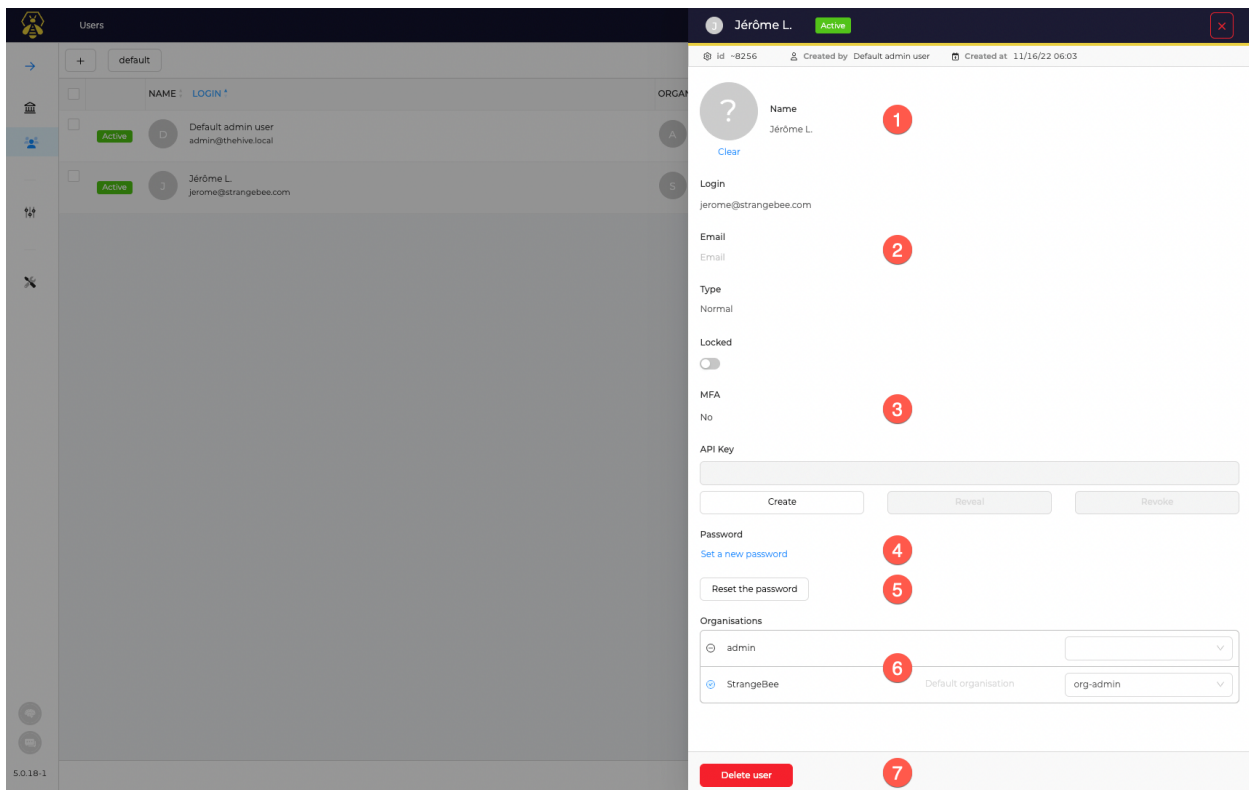

org-admin

Click the + button to add an account in the current organisation, and follow create an account and up date an account guides.

In the list of accounts, click Preview to open accounts details view

5.1.2 Templates

- Case

List of Case Templates

Access

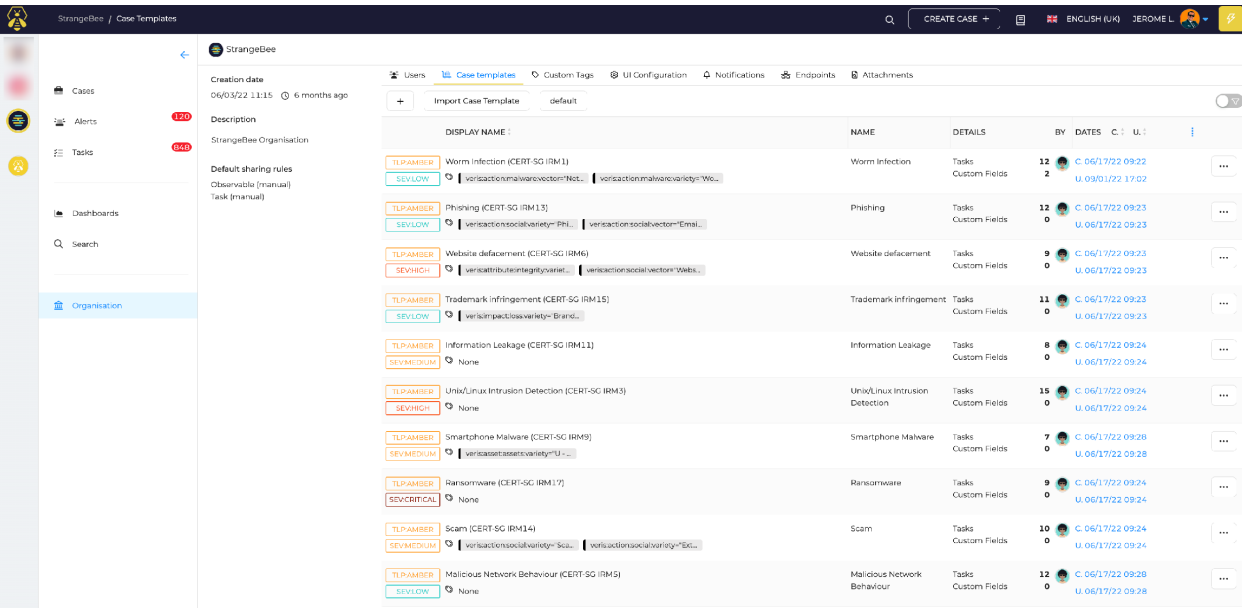

Figure 4: List of case templates

New Case template

Click the + button to create a new Case template.

- with this template
 - **Custom Fields :** Add Custom fields to the template. Default value can be set for Custom fields as well.
 - **Pages :** Add pages template to the template. They will be automatically added to the Case when created with this template
- Pages

Figure 7: New Page template

Configuration parameters

- **Title** : Page template title. Used to identify the Page template with the API. Also used as a page title when the template is used in a case.
- **Category** : Category for grouping pages on a common theme is used as a page tree in the case of.
- **Content** : Default page content when the page template is used in a case.

5.1.3 Tags

Custom tags

Custom tags collect all tags from Alerts or added to Cases or Observables that are not included in TheHive T

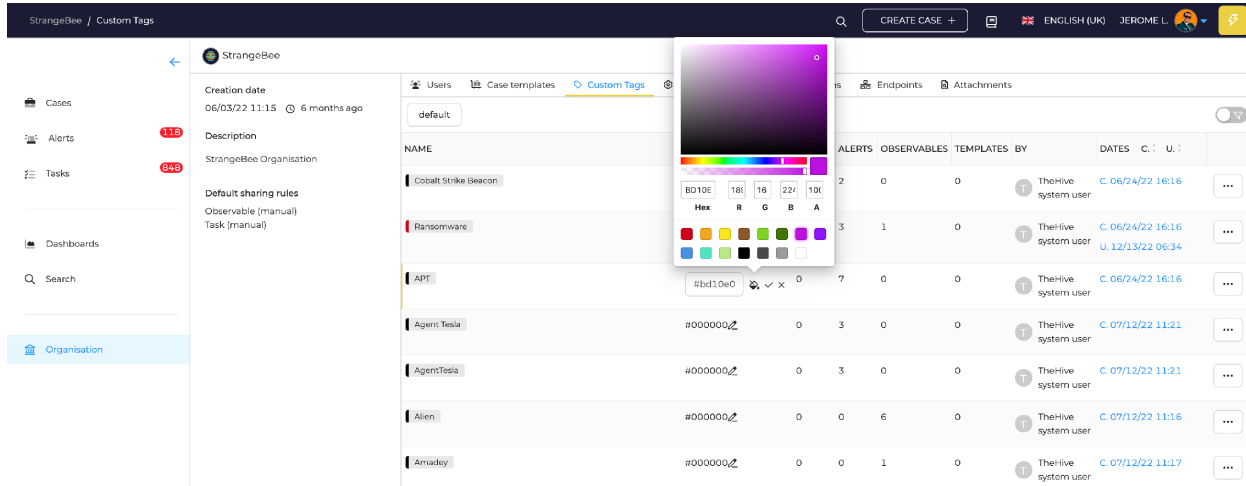

Figure 8: Custom tags

Configuration

- Names and colors can be adjusted for all Custom tags
- Each tag can also be deleted

Warning: Deleting a tag from this menu will remove the tag on every Alert, Case and Observables in the organisation.!

5.2 Analyst

5.2.1 Cases

- Create

Create new cases

A User can create new cases using templates. Click Create Case + on the header

Figure 9: create case header

A new screen opens. A user can create cases by selecting any one of the following options:

Click the below links to create each type of new case.

Empty Case EDR / Phishing Template Archive MISP

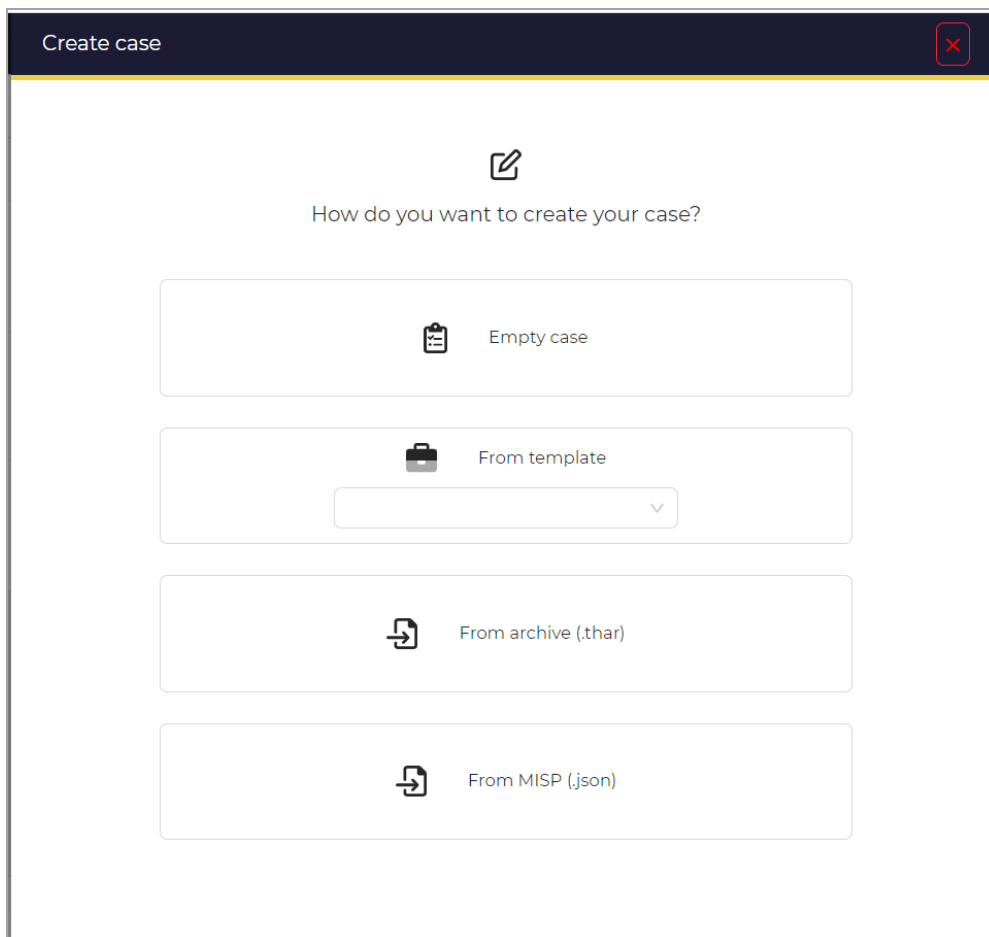

Figure 10: create case

From an empty case

Create a new case from an empty case.

- Enter the case title in the Title.
- Select the date from the Date.
- Select Severity, (Low/Medium/High/Critical).
- Select TLP , (White/Green/Amber/Red).
- Select PAP , (White/Green/Amber/Red).
- Click + to add Tags. (Refer to Add tags).
- Enter the case description in the Description.
- Choose a Task rule from the list, (manual/existingOnly/upcommingOnly/all).
- Choose an Observable rule from the list, (manual/existingOnly/upcommingOnly/all).
- Add Tasks. (Refer to Add tasks).
- Add Custom Fields. (Refer to Add custom field values).

The screenshot shows a mobile application interface for creating a new case. The form is titled "Create case" and has a dark blue header with a back arrow and a close button. The form fields are as follows:

- Title ***: A text input field with the placeholder "Case title...".
- Date ***: A date and time picker showing "17/02/2022 07:13".
- Severity**: Four buttons labeled "LOW", "MEDIUM", "HIGH", and "CRITICAL". "MEDIUM" is selected.
- TLP**: Four buttons labeled "TLP:WHITE", "TLP:GREEN", "TLP:AMBER", and "TLP:RED". "TLP:AMBER" is selected.
- PAP**: Four buttons labeled "PAP:WHITE", "PAP:GREEN", "PAP:AMBER", and "PAP:RED". "PAP:AMBER" is selected.
- Tags ****: A text input field with the placeholder "Tags" and a "+" button to add tags.
- Description ****: A rich text editor with a toolbar and a "Preview" button. The placeholder text is "Describe the case here...".

Below the description field, there is a message: "At least, one required field **".

At the bottom of the form, there are two tabs: "Tasks" and "Custom fields". The "Tasks" tab is active, showing a message: "No tasks have been found. Add a task". There is a blue button labeled "Add a task" and a red box around it.

At the very bottom, there are two buttons: "Cancel" and "Confirm case creation". The "Confirm case creation" button is highlighted with a red box.

Figure 11: create empty case

From template

- Enter the case title in the Title.
- Select the date from the Date.
- Select Severity , (Low/Medium/High/Critical).
- Select TLP , (White/Green/Amber/Red).
- Select PAP , (White/Green/Amber/Red).
- Click + to add Tags. (Refer to Add tags.)
- Enter the case description in the Description.
- Choose a Task rule from the list, (manual/existingOnly/upcommingOnly/all).
- Choose an Observable rule from the list, (manual/existingOnly/upcommingOnly/all).
- Add Tasks. (Refer to Add tasks. / Edit tasks. /Delete tasks.)
- Add Custom Fields. (Refer to Add custom field values. /Edit custom field values. /Delete custom field values.)
- Add Pages. (Refer to Add pages. /Delete pages.) Sharing (Refer to Sharing.)

The screenshot shows a web interface for creating a case from a template. The title bar indicates the template is 'Worm infection (CERT-SG IRM1)'. The form fields are as follows:

- Title:** EDR Worm infection
- Date:** 2023-06-26
- Severity:** LOW (selected), MEDIUM, HIGH, CRITICAL
- TLP:** TLP-CLEAR, TLP-GREEN, TLP-AMBER (selected), TLP-AMBER-STRICT, TLP-RED
- PAP:** PAP-CLEAR, PAP-GREEN, PAP-AMBER (selected), PAP-RED
- Tags:** CERT:SLM:malicious-code="worm"
- Description:** Worm infection

Below the form, there is a 'Tasks' section with a list of tasks and their status. The 'Add task' button is highlighted. The 'Confirm' button is highlighted at the bottom right.

Flag/Unflag

Click the Flag/Unflag option to either flag or unflag a case. A pop-up message appears

Close case

Click the Close option to remove a case A new window opens .

- Select Status from the list.
- Change the Summary
- Click the Close tasks and case button.

5.3 Observables

5.3.1 Create Case Observables

In a TheHive case, observables can be declared. Open the Observables list (Case > Observables) to create an observable. You must have permission to administer cases.

The Add observable icon is located on the Observables tab:

Figure 21: Adding observables

In the pop-up, you are invited to fill the observable(s) details:

- Type *: The observable dataType (e.g.: ip, hash, domain, ...)
- Value *: Your observable value (e.g.: 8.8.8.8)
 - **One observable per line:** Create one observable p er line inserted in value field.
 - **One single multiline observable:** Create one observable, no matter the number of lines (useful for long URLs for example).
- TLP *: Define here the way the information should be shared.
- Is IOC: Check it if this observable is considered as Indicator of Compromission.
- Has been sighted: Has this observable been sighted on y our information system.
- Ignore for similarity: Do not correlate this observable with other similar observables.
- Tags **: Tag your observable with insightful information.
-

The screenshot shows a modal window titled 'Adding an Observable'. It contains several input fields and buttons. At the top, there is a dropdown menu for 'Type' with 'ip' selected. Below it is a text input field for 'Value' containing '103.94.135.159'. To the right of the 'Value' field, there is a toggle switch for 'One observable per line' which is turned on, and a label '1 observable(s)'. Below the 'Value' field, there are two rows of buttons for TLP (TLP: CLEAR, TLP: GREEN, TLP: AMBER, TLP: AMBER+STRICT, TLP: RED) and PAP (PAP: CLEAR, PAP: GREEN, PAP: AMBER, PAP: RED). The 'TLP: AMBER' and 'PAP: AMBER' buttons are highlighted in orange. Below these are three toggle switches for 'Is IOC', 'Has been sighted', and 'Ignore similarity', all of which are currently turned off. There is a text input field for 'Tags' containing 'not malicious'. At the bottom, there is a rich text editor for 'Description' with the text 'Hello good! :)'. At the very bottom of the modal, there are three buttons: 'Cancel', 'Save and add another', and 'Confirm'.

Figure 22: Creating observables

Finally , click on Create Observable(s)
